

DYNASTY

DYNAmics and STructural anaLYsis of 2D materials

IESL SEMINAR
Tuesday 10/10/2023, 11:00
FORTH Seminar Room 1

**STEM advanced characterization of
2D materials: beyond graphene**

Dr. Nicolas.Gauquelin

University of Antwerp (UA), NANOlaboratory, Antwerpen, Belgium

e-mail: Nicolas.Gauquelin@uantwerpen.be

Abstract:

In this seminar, I will talk about advanced electron microscopy characterization of 2D materials. I will start by making an introduction to TEM and STEM as well as 2D. In a second part I will review what has been done on graphene with imaging (determination of the number of layers, moiré patterns, defects and impurities. I will finish by introducing 4D-STEM and recent developments in our about mapping the orientations of graphene with the SEM.[1] I will then introduce spectroscopies (EDX and EELS) and their use in graphene characterization.[2] The lecture will continue focus on Transition metal dichalcogenides (TMD) focusing on MoS₂ and WS₂ and the determination of the stacking [3-4]. I will then talk about exfoliated perovskites and their use [5]. To finish I will report some recent work on Black Phosphorus (BP) [6] and the more exotic charge density wave (CDW) materials rare-earth chalcogenides.[7].
